INTRODUCTION

In June 1976 an informal agreement was made with the Water Works Department of the Navajo Tribe (now Division of Water and Sanitation) whereby cuttings from Tribal water wells drilled in New Mexico would be turned over to the New Mexico Bureau of Mines and Mineral Resources for cataloging and permanent filing in their sample library. It was further agreed that copies of any descriptions made of the samples would be furnished to the Tribe. This agreement is mutually beneficial because, although cuttings are usually collected from Tribal wells and described in the field, samples are not always further studied in the laboratory or permanently filed. Under the present agreement not only may the Tribe and the Bureau routinely obtain more detailed stratigraphic records for numerous wells but the samples will be preserved for future use through storage in an established cuttings library.

USING THIS REPORT

Only descriptions of cuttings received prior to January 1978 are included in this report; Table 1 (p. 9) is a catalog of wells for which sample descriptions are given. In this tabulation, wells are grouped by county and arranged by BIA (Bureau of Indian Affairs) field number. This number consists of 2 numerals and a letter: 14T-569. The first numeral identifies the BIA District (fig. 1a). The letter, since about 1950, denotes the source of funds used to construct the well. Common designations are: K = BIA funds and T =

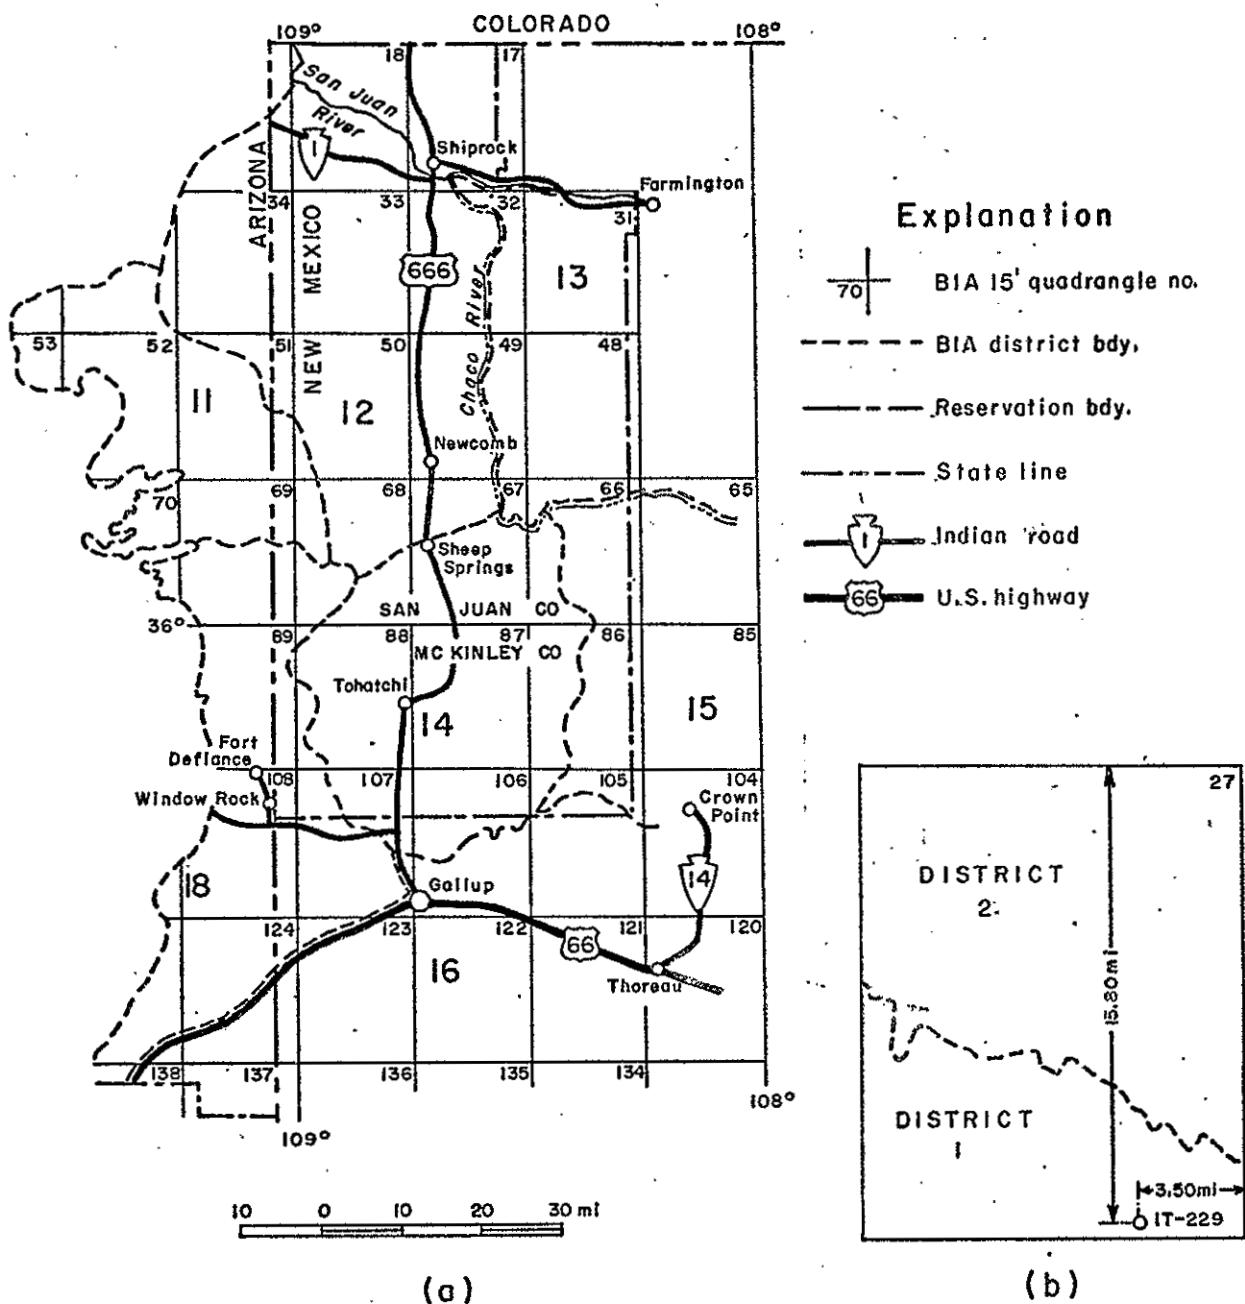

Figure 1. Reference map for northwestern New Mexico and key to numbering of Navajo water wells: a) location of BIA districts and 15' quadrangles associated with New Mexico portion of Navajo Indian Reservation; b) derivation of BIA quadrangle location numbers for wells (example shown has field number of 1 T-229 and quadrangle location number of 27-3.50-15.80).

Tribal funds. The significance of other letter designations used is less clear. The third part is an accession number for that district, representing the order in which the well was drilled. In addition to the well number, the township-range location, total well depth, sampled interval, probable aquifer, and pages covered by the description are also given.

Table 1 may be used in 2 ways: 1) to determine the availability of sample descriptions for a specific well of interest and 2) to determine the identity of wells for which there are samples or sample descriptions in a general area of interest. In the first case, look for the well in Table 1 using the BIA field number. If it is listed, a sample description is included in this report and cuttings are on file in the Bureau. In the second case, consult Table 1 for the area of interest using county and BIA district number (fig. 1). Samples and sample descriptions are available for all wells listed.

EXPLANATION OF DESCRIPTIONS

The descriptions which follow were made by conventional study of the cuttings with a binocular microscope. Abundances and textural characteristics are based on visual estimates following Terry and Chilingar (1958) and Powers (1953). All abbreviations used are defined in the "Key to Symbols and Terms" (p.11). Each description includes the following heading information: well number, location, sampled interval, sample spacing, total depth (TD), name of analyst, and date of

description. The well number given is generally the BIA field number.

Where possible, location is given according to:

1) standard legal description (section, township, range, county; for this the land grid was extended into the reservation from adjacent areas), 2) distance and direction from a local landmark, and 3) location within BIA quadrangle. The BIA quadrangle location number consists of 3 parts (for example 27-3.50-15.80). The first part is the number of the BIA quadrangle in which the well is located (fig. 1). The second is the distance in miles west of the northeast corner of the quadrangle, and the third part is the distance in miles south of the northeast corner of the quadrangle (fig. 1b).

Wells are arranged by county, then well number or name as in Table 1. Descriptions are presented in the order that the materials were encountered in drilling and depths of intervals described therefore increase down the page. The probable stratigraphic units (formations, groups, etc.) penetrated by the well are indicated by the abbreviations in the Depth column at the left. The term in caps at the beginning of each descriptive entry identifies the probable major rock or sediment type(s) in the interval indicated, based on examination of the cuttings. A single lithologic term is listed where it is deemed to constitute >50 percent of the total sample. Two lithologic terms joined by "and" are listed

where each constitutes 30-50 percent of the total sample.

Other abundance terms are defined in the "Key to Symbols" (p.11).

The specific descriptive information given after the general lithologic term(s) varies slightly with rock types; for clarity, this information is always presented in the same order as follows:

SANDSTONES -- color; texture (grain size, grain sorting, grain shape); mineralogy; matrix, cement, induration; miscellaneous constituents or characteristics.

CLAYEY OR SILTY SANDSTONES -- color; texture (of sand); general comment on clay or silt; mineralogy; matrix, cement, induration; miscellaneous constituents or characteristics.

SHALE, SILTY SHALE, OR SILTSTONE -- color; general comment on silt or sand (if present); cement, induration; miscellaneous constituents or characteristics.

SANDY SILTSTONE OR SANDY SHALE -- color; texture of sand grains; mineralogy of sand grains; cement, induration; miscellaneous constituents or characteristics.

The rock color chart prepared by Goddard and others (1948) and distributed by the Geological Society of America (GSA) was used for rock color designations. In several cases, however, identical names are given on the chart for two slightly different colors, such that name alone cannot be used without creating doubt as to the color intended. Usage of such duplicate color designations in this report is clarified in the list below:

Grayish orange pink = 5 YR 7/2
Moderate orange pink = 10 R 7/4
Light brown = 5 YR 6/4
Grayish red = 10 R 4/2

Yellowish gray = 5 Y 7/2
 Light greenish gray = 5 G 8/1
 Greenish gray = 5 G 6/1
 Light olive gray = 5 Y 6/1
 Olive gray = 5 Y 3/2
 Dark greenish gray = 5 G 4/1
 Pale yellowish gray (GSA's yellowish gray) = 5 Y 8/1
 Pale greenish gray (GSA's light greenish gray) = 5 GY 8/1
 Olive greenish gray (GSA's greenish gray) = 5 GY 6/1
 Pale olive gray (GSA's light olive gray) = 5 Y 5/2
 Medium olive gray (GSA's dark greenish gray) = 5 GY 4/1
 Moderate olive gray (GSA's olive gray) = 5 Y 4/1

All other color designations follow the GSA chart exactly.

The example below should aid in using the descriptions:

200-230 SANDSTONE and SILTSTONE--ss wh; grains f to m, mod w sorted, subang, spher; milky qtz; clay and silt mat, tr silica cem, fri. Slst It gry; w ind; carb.

This description covers material from an interval lying between 200 and 230 feet below the surface. The interval is concluded to consist of nearly equal amounts sandstone and siltstone (each constituting 30-50 percent of the sample). The sandstone is white, moderately well sorted, with subangular spherical grains of milky quartz in the fine to medium size range (0.125-0.5mm). It is also friable (crumbly) with only a trace of silica cement between the grains but has an intergranular matrix consisting of clay and silt. The siltstone is light gray, cemented by undetermined material, well indurated (hardened), and contains carbonaceous material.

The designations of probable stratigraphic units penetrated are based on Bureau maps of depth-to-top of selected units in northwestern New Mexico prepared in conjunction with a current study of the hydrogeology of that region. Where well locations are incomplete or imprecise, the maps are of little use and the probable stratigraphic units penetrated are omitted.

- 778-88 SHALE and SILTSTONE--sh m gry. Slstst pale red; lit f to vc sand; qtz, lit muscovite; fri.
- 788-808 SHALE--aa. Lit slstst aa.
- 810-20 SANDSTONE and SHALE--ss wh; grains m, w sorted, srd to subang, spher; clear and milky qtz, tr muscovite; silica cem. Sh m gry. Tr coal.
- 828-48 SHALE and SANDSTONE--sh lt gry and pale red. Ss wh and lt gry; grains m to vcrse, p sorted, subang to srd, spher to platey; clear and milky qtz; some slt mat; silica and tr pyrite cem.
- 848-68 SANDSTONE and SHALE--ss lt gry; grains crse to vcrse, loose, w sorted, subang to srd; spher, clear qtz. Sh lt gry and dk reddish brn.
- 868-908 SILTSTONE--m gry and gry red; qtz and muscovite. Lit ss lt gry; grains crse to vcrse, loose, subang, spher to platey; clear qtz. Lit sh m gry and gry red.
- 908-18 SHALE--m gry.

- 918-28 SHALE--m gry. Lit Ss lt gry; grains vcrse, loose,
w sorted, subang to srd, spher, clear qtz.
- 928-38 SILTSTONE--lt gry; grains of clear qtz and muscovite.
- 938-58 SANDSTONE--lt gry; grains f, mod sorted, subang to
srd, spher; clear qtz, some muscovite; fri. Sh gry red
and m gry; mod ind.

Well no: 19T-519

To a

- 0-10 SAND--Some pale yel or and wh; grains f to crse, p sorted, srd and subang, spher, clear qtz, tr feldspar; gravel, f, w rd and spher, some aggregated by caliche, others cem by qtz.
- 10-15 SAND--pale yel or; grains m to crse, mod to p sorted, srd, spher; clear and wh qtz tr gypsum, no caliche.
- 15-20 SAND--pale yel or; grains f to crse, p sorted, subang to rd, spher and elongate; clear qtz. Lit f gravel f, rd to ang, spher; qtz, sm dk reddish brn chert; caliche coating grains, tr iron oxide cem.
- 20-25 SAND--pale yel or; grains f to m, mod to p sorted, srd and subang, spher; clear qtz. Some gravel f, ang to subang, spher to oblate; qtz, sm dk reddish bron chert; tr iron oxide cem, tr caliche cem.
- 25-30 SAND--pale yel or and wh; grains m, w sorted, grains srd, spher, clear qtz, lit gypsum; lit caliche cementing grains.
- 30-60 SAND--pale yel or and wh; grains m to crse, mod w sorted, ang to srd, spher and oblate; clear and lt or qtz; lit calc and iron oxide cem.
- 60-65 SAND--wh; grains m to crse, w sorted, ang to srd, spher, oblate; clear qtz; tr iron oxide cem.
- 70-85 SAND--wh and pale yel grains f to crse, p sorted, ang to srd, spher and oblate; clear and m gry qtz; mod amount iron oxide cem; a few grains show conchoidal fracture.
- 85-90 SAND--wh; grains m, v w sorted, ang to srd, spher; clear qtz.
- 100-05 SAND--wh; grains m to crse, mod sorted, ang to w rd, spher to elongate; clear qtz, lit chert; tr iron oxide cem.

105-25 SAND--multicolored; grains m to vcrse, p sorted, ang to srd, spher, elongate and platey; clear qtz, vcrse grained chert, and unidentified rock fragments; tr iron oxide cem.
