MEMO

TO: Frank E. Kottlowski, Director
FROM: Sam Thompson III, Petroleum Geologist
SUBJECT: Open-file report no. OF-151

As we discussed, the following report from GeoChem Laboratories, Inc. is to be placed in the Bureau Open-file:

OF-151 Hydrocarbon source-rock evaluation study, Cockrell Corp. No. 1 Playas State well, Hidalgo County, New Mexico, by L. Paul Tybor, GeoChem Laboratories, Inc., 1981, 23 p. (including 2 p. text, 8 tables, 9 charts)

RE: GeoChem Job No. 2082
Cockrell #1 Playas Well
Sec. 14-30S-17W
Hidalgo County, New Mexico

Dear Mr. Thompson:

Enclosed please find the results of the organic geochemical analyses performed on forty-six (46) well cuttings samples from the Cockrell No. 1 Playas well, located in Sec. 14-30S-17W, Hidalgo County, New Mexico.

Upon arrival at GeoChem the samples were assigned the GeoChem Job Number 2082, followed by the sample sequential number -001 to -046, and submitted to the following geochemical analytical program:

TYPE OF ANALYSIS TABLE

Total organic carbon determination
and brief lithological description I

Pyrolysis II

C₁₅₊ soxhlet extraction, deasphalting,
and liquid chromatographic separation..... III-A,-B,-C

C₁₅₊ paraffin-naphthene gas
chromotography IV-A,-B

Visual kerogen assessment V

Vitrinite reflectance analysis VI; Histograms

DISCUSSION OF THE RESULTSA. Thermal Maturity of Sediments

Based on kerogen coloration, the Paleozoic sediments analyzed from this well range in thermal maturity from a mature Maturation Index Stage 2+ to 3- at 2500+ feet, within the Horquilla formation, to a severely altered Maturation Index Stage 3+ to 4- at 6820+ feet, within the Bliss formation. On the basis of this thermal maturation profile the Horquilla is the only unit in this well which could have generated oil. Below the Horquilla, the maturities of these sediments increase to very mature levels to the Montoya formation. From the El Paso to total depth in the Bliss formation, the thermal maturities attain severely altered levels.

As a result, wet gas and minor amounts of condensate may have been generated in the rocks comprising the well interval from the Mississippian Paradise formation through the Ordovician Montoya formation. Below the Montoya, within the El Paso, to total depth within the Bliss, only gas could have been generated.

The results obtained from the vitrinite reflectance analyses indicate a slightly higher level of thermal maturation for these sediments. However, this discrepancy does affect our interpretation of the thermal maturity of these sediments since it appears that only varying amounts of gas could have been generated from these rocks.

B. Hydrocarbon Source Characterization of Sediments

The Paradise, the lower portion of the Percha, the Montoya and the Bliss stratigraphic rock units penetrated by this well have a very mature to severely altered, poor liquid hydrocarbon source character, with a possible fair gas source character.

This fair gas source character is based on the fair amounts of organic matter analyzed from these units (Table I). These units have poor liquid hydrocarbon generating capabilities due to the poor amounts of C₁₅₊ total hydrocarbon (Table III-B), free hydrocarbon yields (S₁; Table II) and remaining hydrocarbon generating potential (S₂; Table II) analyzed from these samples.

The remaining formations analyzed in this well study were analyzed as being organic-lean with poor hydrocarbon generating characteristics.

Should you have any questions concerning this study, or if I may be of further service, please feel free to contact me.

Sincerely,

Paul Tybor
GEOCHEM LABORATORIES, INC.
