This susceptibility map displays information on the potential for deep-seated landslide occurrence in New Mexico. The map is based on geographic and geologic data, and it should not be used for determining specific site conditions or for site-specific landslide susceptibility evaluations. The information presented is intended for use at a spatial scale of 1:750,000 for regional planning purposes and for determining where more detailed studies may be warranted. This map is neither designed nor adequate for risk assessment, nor is it intended or adequate for use at a spatial scale of 1:15,000 for determining the frequency at which adequate driving forces to occur, nor does it contain information on the potential for adequate driving forces to occur.

**Comments to Map Users**

The user should interpret the susceptibility classes with caution and should not rely on this map for either expressed or implied policies, either expressed or implied, of the State of New Mexico. The views and conclusions presented here should not be interpreted as necessarily representing the official views or policies of the New Mexico Bureau of Geology and Mineral Resources. The New Mexico Bureau of Geology and Mineral Resources shall not be liable under any circumstances for any direct, indirect, special, incidental, or consequential damages with respect to claims by users of this product. The views and conclusions presented here should not be interpreted as necessarily representing the official views or policies of the State of New Mexico.

The map was produced by Colin T. Cikoski and Daniel J. Koning. The authors acknowledge the contributions of the New Mexico Bureau of Geology and Mineral Resources and New Mexico Tech.
