

## **Rb-Sr and K-Ar ages and Sr isotopic compositions of some granitic rocks of Oregon and Washington**

R.L. Armstrong, W.H. Taubeneck, and P.O. Hales

Isochron/West, Bulletin of Isotopic Geochronology, v. 17, pp. 27-32

Downloaded from: <https://geoinfo.nmt.edu/publications/periodicals/isochronwest/home.cfml?Issue=17>

---

Isochron/West was published at irregular intervals from 1971 to 1996. The journal was patterned after the journal *Radiocarbon* and covered isotopic age-dating (except carbon-14) on rocks and minerals from the Western Hemisphere. Initially, the geographic scope of papers was restricted to the western half of the United States, but was later expanded. The journal was sponsored and staffed by the New Mexico Bureau of Mines (now Geology) & Mineral Resources and the Nevada Bureau of Mines & Geology.

All back-issue papers are available for free: <https://geoinfo.nmt.edu/publications/periodicals/isochronwest>

This paper contains supplemental analytical and locality data for samples discussed in our Geological Society of America paper on the Mesozoic granitic rocks of Oregon, Washington, and Idaho (Armstrong, Taubeneck, and Hales, 1976). Supplemental data for the samples from Idaho were included in a recent review of the geochronometry of Idaho (Armstrong, 1975). Also included in this paper are data for one sample from southern Oregon which has been reported only in an abstract (Muntzert and Field, 1969).

The Ar data were determined by standard isotope dilution techniques at Yale University and Columbia University. K analyses at Yale were done by atomic absorption and at Columbia by flame photometer. The K-Ar dates are computed using the following constants:  $K^{40} = 0.0119$  atom percent;  $K\lambda_B = 4.72 \times 10^{-10}$  yr $^{-1}$ ,  $K\lambda_e = 0.584 \times 10^{-10}$  yr $^{-1}$ . Rb/Sr ratios were determined by x-ray fluorescence and Sr isotopic compositions measured on an automated 60-degree-sector 12-inch-radius solid source mass spectrometer at Yale University. Uncertainties reported are for one standard deviation.

This research was supported by National Science Foundation grants G-14553, GA-31852 and GA-26025.

SAMPLE DESCRIPTIONS

1. Bald Mountain batholith

Rb-Sr ( $\lambda = 1.42$ )

(whole rock) (except 2 aplites) 147±17 m.y.  
 Initial  $Sr^{87}/Sr^{86} = 0.70391 \pm 0.00008$   
(whole rock - aplite) (252) 158±8 m.y.  
 Initial  $Sr^{87}/Sr^{86} = 0.70388 \pm 0.00003$   
(whole rock - aplite) (821) 140±7 m.y.  
 Initial  $Sr^{87}/Sr^{86} = 0.70393 \pm 0.00003$

Specimen	N Latitude	W Longitude	County	State
1 25 granodiorite	44°56'37"	118°9'14"	Baker	OR
2 32 quartz diorite	44°52'15"	118°11'40"	Baker	OR
3 35 quartz diorite	44°52'13"	118°9'53"	Baker	OR
4 140 granodiorite	44°56'24"	118°13'45"	Baker	OR

24. YU-JM-291	K-Ar	(biotite) $32.6 \pm 1.0$ m.y. (hornblende) $33.6 \pm 1.0$ m.y.															
Hornblende-biotite adamellite ( $42^{\circ}37'40''$ N, $120^{\circ}32'0''$ W; NE/4 sec. 13, T34S, R18E; Lake Co., OR). E flank of Paisley Mountains, 10 km S of Paisley. The hornblende separate contains about 5% biotite. <u>Analytical data:</u> (biotite) K = 5.54, 5.45%; $*Ar^{40}$ = 7.23, $7.23 \times 10^{-6}$ cc/gm (50, 57% $\Sigma Ar^{40}$ ); (hornblende) K = 1.27, 1.26%; $*Ar^{40}$ = $1.71 \times 10^{-6}$ cc/gm (29% $\Sigma Ar^{40}$ ). <u>Collected by:</u> J. K. Muntzert and C. W. Field, Ore. State U.; <u>dated by:</u> R. L. Armstrong and P. N. Taylor, Yale U.																	
25. Granitic steepes SE Washington																	
	Rb-Sr	Age Indeterminant Initial $Sr^{87}/Sr^{86}$ variable
