Fission-track dates from the White River Formation, Shirley Basin, Uranium District, Wyoming

R.A. Zielinski and C.W. Naeser

Isochron/West, Bulletin of Isotopic Geochronology, v. 18, pp. 19-20

Downloaded from: https://geoinfo.nmt.edu/publications/periodicals/isochronwest/home.cfml?Issue=18

Isochron/West was published at irregular intervals from 1971 to 1996. The journal was patterned after the journal *Radiocarbon* and covered isotopic age-dating (except carbon-14) on rocks and minerals from the Western Hemisphere. Initially, the geographic scope of papers was restricted to the western half of the United States, but was later expanded. The journal was sponsored and staffed by the New Mexico Bureau of Mines *(now Geology)* & Mineral Resources and the Nevada Bureau of Mines & Geology.

All back-issue papers are available for free: https://geoinfo.nmt.edu/publications/periodicals/isochronwest

FISSION-TRACK DATES FROM THE WHITE RIVER FORMATION, SHIRLEY BASIN, URANIUM DISTRICT, WYOMING

by Robert A. Zielinski and Charles W. Naeser, U.S. Geological Survey, Denver, CO 80225

The White River Formation in the Shirley Basin District of Wyoming consists of as much as 850 ft (261.5 m) of interbedded fluvial and lacustrine rhyolitic tuff, tuffaceous siltstone, sandstone, claystone, and minor conglomerate and carbonate rocks. In most of the area the tuffaceous units directly overlie arkosic sandstone of the Wind River Formation (Eocene), which contains major uranium deposits (fig. 1). Downward percolation of uraniferous groundwater through tuffs and its lateral movement within the sandstone of the Wind River Formation are thought to be the path of uranium transport (Harshman, 1972). Nearby Precambrian granites exposed during Paleocene-Eccene time and the tuffs of the White River Formation (Oligocene) are both thought to be likely source rocks for the uranium. Clearly, if the uranium deposits were found to be older than the oldest tuffaceous units. White River tuff could not be a major uranium source. The data that follow indicate a maximum age of 32 ± 3 m.y.

for the White River Formation in the Shirley Basin. Vertebrate fossil evidence from the White River Formation yields ages from early Oligocene (Chadronian provincial age) to middle Oligocene (Orellan provincial age) (Wood, 1948; Van Houton, 1954; Rich, 1962; Harshman, 1972). K-Ar age determinations on biotite separates from middle and lower members of the White River Formation near Alcova Reservoir, 8 mi west of the sampling area (fig. 1) and points farther west give ages in the range from 31.6 to 35.7 ± 2 m.y. (Love, 1970; Evernden and others, 1964).

Recent attempts using U-Pb isotope systematics to date massive pitchblende and calcite-cemented uranium ores from the Shirley Basin have generated estimated *minimum* ages from 24 ± 3 m.y. to 35 m.y. (K. R. Ludwig, written communication). In the absence of significantly older ages, White River tuff must be considered a probable source because of its favorable spatial and temporal relationship to the deposits.

SAMPLE DESCRIPTIONS

Dates were determined using zircon separates from outcrop samples according to the method of Naeser (1969). Reported analytical errors are $\pm 2\sigma$ and represent errors of counting statistics. The fission decay constant (λ_F) used for U²³⁸ is 6.85 x 10⁻¹⁷ yr⁻¹ (Fleisher and Price, 1964). Samples were irradiated in the U.S. Geological Survey TRIGA reactor in Denver.

- 1. WTR-SB2 Fission track Rhyolite tuff (fig. 1), middle member, White River Formation (NW¼ sec. 32, T. 29 N., R. 77 W.; 42° 26.0'N., 106°6.0'W.; Natrona Co., WY). Gray glassy tuff with accessory plagioclase, biotite, and magnetite; minor calcite and clay alteration products. Analytical <u>data:</u> Six grains counted, $P_s = 4.96 \times 10^6 \text{ tracks/cm}^2$ (838 tracks counted), $P_i = 10.15 \times 10^6 \text{ tracks/cm}^2$ (858 tracks counted), $\phi = .98 \times 10^{15} \text{ n/cm}^2$, $U_{zircon} \approx$ 29.3±2.8 m.y. 315 ppm.
- 2. <u>75-SB-8</u> Fission track Tuffaceous siltstone (fig. 1), lower member, White River Formation (SW¼ sec. 2, T. 29 N., R. 80 W.; 42° 30.2'N., 106°23.7'W.; Natrona Co., WY). Rhyolite glass with minor biotite and major calcite and clay alteration products. Analytical data: Six grains
